This work was supported in part by the Department of Electrical Engineering, Indian Institute of Technology Madras, Chennai, through the Science and Engineering Research Board (SERB) Teachers Associateship for Research Excellence Scheme, under Grant TAR/2020/000149.

**ABSTRACT** This paper reports the experimental investigation of the corona discharge activity of punga oil under the influence of a local magnetic field and different voltage profiles (AC and DC voltages) using fluorescent fiber sensor as well as UHF sensor technique. The corona inception voltage (CIV) of punga oil is higher under negative DC voltage followed by positive DC and AC voltage, with a marginal reduction in its CIV magnitude observed on the impact of external magnetic field. The dominant frequency of the UHF signal obtained under AC voltage shifted towards lower frequency (0.6 GHz) with the influence of magnetic flux density to about 85 mT. The rise time, pulse width and energy content of the fluorescent signal formed due to corona activity under AC voltage is found to vary under high magnetic fields confirming the inception results. The fluorescent signals formed due to corona discharge under both AC and DC voltages have its dominant frequency at 1 MHz with no shift observed in the presence of magnetic field. Also, there is no variation in the phase resolved partial discharge (PRPD) pattern observed due to corona discharge (with and without magnetic field) signal using both UHF sensor and the fluorescent sensor. The fluorescent fiber-based technique provides a better accuracy on detecting the corona discharges in punga oil at an early stage compared to conventional UHF sensor. The breakdown voltage of punga oil under different voltage profiles with and without the effect of magnetic field follows normal distribution. The dielectric dissipation factor and electrostatic charging tendency (ECT) of punga oil is observed to be higher than the limit set for insulating fluids towards power transformer operation.

**INDEX TERMS** Corona discharge, magnetic field, fluorescent fiber, UHF sensor, rise time, streaming current.

## I. INTRODUCTION

The insulation design of oil-filled power transformers is vital for their longevity and reliable operation in a power system network. Mineral oils have been traditionally used as an insulant and coolant in the power transformers. However, with the recent shortfall of the global oil supply and a general depletion of non-renewable sources, a serious shortage may be expected in the near future [1]. While installing the

transformers, fire protection is a primary concern, as they are frequently positioned in high-risk situations such as within buildings and underground installations. Nevertheless, the higher thermal class of ester fluids [2] compared to mineral oil makes them suitable to be placed closer to the buildings, resulting in lower power losses. In view of this, alternative insulants such as vegetable oils (soybean, sunflower, punga) are now being tested for transformer applications [3]. In comparison to the conventional mineral oil, these ester-based fluids derived from various plant seeds have shown better fire class properties with increased

**Abstract:** The usage of electric vehicles (EV) has been increasing over the last few years due to a rise in fossil fuel prices and the rate of increasing carbon dioxide (CO<sub>2</sub>) emissions. EV-charging stations are powered by existing utility power grid systems, increasing the stress on the utility grid and the load demand at the distribution side. DC grid-based EV charging is more efficient than AC distribution because of its higher reliability, power conversion efficiency, simple interfacing with renewable energy sources (RESs), and integration of energy storage units (ESU). RES-generated power storage in local ESU is an alternative solution for managing the utility grid demand. In addition, to maintain the EV charging demand at the microgrid levels, energy management and control strategies must carefully power the EV battery charging unit. In addition, charging stations require dedicated converter topologies, control strategies, and need to follow set levels and standards. Based on EV, ESU, and RES accessibility, different types of microgrid architecture and control strategies are used to ensure optimum operation at the EV-charging point. Based on the above said merits, this review paper presents different RES-connected architecture and control strategies used in EV-charging stations. It highlights the importance of different charging station architectures with current power converter topologies proposed in the literature. In addition, a comparison of microgrid-based charging station architecture with its energy management, control strategies, and charging converter controls are also presented. The different levels and types of charging stations used for EV charging, in addition to controls and connectors used, are also discussed. An experiment-based energy management strategy was developed to control power flow among the available sources and charging terminals for the effective utilization of generated renewable power. The main motive of the EMS and its control is to maximize the usage of RES consumption. This review also provides the challenges and opportunities in EV-charging, and parameters in selecting appropriate charging stations.

**Abstract:** Air pollution is one of the major concerns considering detriments to human health. This type of pollution leads to several health problems for humans, such as asthma, heart issues, skin diseases, bronchitis, lung cancer, and throat and eye infections. Air pollution also poses serious issues to the planet. Pollution from the vehicle industry is the cause of greenhouse effect and CO<sub>2</sub> emissions. Thus, real-time monitoring of air pollution in these areas will help local authorities to analyze the current situation of the city and take necessary actions. The monitoring process has become efficient and dynamic with the advancement of the Internet of things and wireless sensor networks. Localization is the main issue in WSNs; if the sensor node location is unknown, then coverage and power and routing are not optimal. This study concentrates on localization-based air pollution prediction systems for real-time monitoring of smart cities. These systems comprise two phases considering the prediction as heavy or light traffic area using the Gaussian support vector machine algorithm based on the air pollutants, such as PM<sub>2.5</sub> particulate matter, PM<sub>10</sub>, nitrogen dioxide (NO<sub>2</sub>), carbon monoxide (CO), ozone (O<sub>3</sub>), and sulfur dioxide (SO<sub>2</sub>). The sensor nodes are localized on the basis of the predicted area using the meta-heuristic algorithms called fast correlation-based elephant herding optimization. The dataset is divided into training and testing parts based on 10 cross-validations. The evaluation on predicting the air pollutant for localization is performed with the training

## Abstract

In the last decade, numerous energy management techniques have been presented. All of them have common objectives of minimizing the cost, PAR, and carbon emissions. In this manuscript, an optimal energy management (EM) on grid connected micro grid (MG) choosing energy scheduling with low emission and cost using hybrid technique is proposed. The proposed system is combination of Side-Blotched Lizard Algorithm (SBLA) and Chaos Game Optimization (CGO) Algorithm; thus it is called SBLA-CGO technique. The micro grid system consists of Photo-Voltaic (PV) system, Wind Turbine (WT), Battery Storage (BS), and Fuel cell (FC). The needed load demand of the grid connected MG system is continuously measured by SBLA method. Perfect combination of MG is increased via CGO along forecasted load demand circumstance. Moreover, the renewable energy (RE) predicting errors are assessed twice by micro grid EM to diminish the control. Several renewable energy source (RES) are considered by MG scheduling process to reduce the cost of electricity utilizing first method. The second method consists of balancing the power flow (PF) and reducing the effects of forecast errors according to rule given as programmed power reference. The major purpose of proposed method is assessed through the incorporation of FC, variation of hourly power of electrical network, cost of operation through preservation of system of microgrid linked to the network. According to RES, the power requirement and SOC of storage elements are the conditions. Batteries are

This work was supported in part by the Department of Science and Technology, Government of India, for the project titled, "Design and Development of Smart Grid Architecture with Self Healing Capability Using Intelligent Control Techniques-A Smart City Perspective" through AISTIC Scheme under Grant CRD/2018/000075.

**ABSTRACT** This paper presents the design and implementation of Modular Multilevel Inverter (MMI) to control the Induction Motor (IM) drive using intelligent techniques towards marine water pumping applications. The proposed inverter is of eleven levels and has the ability to control the speed of an IM drive which is fed from solar photovoltaics. It is estimated that the energy consumed by pumping schemes in an onboard ship is nearly 50% of the total energy. Considering this fact, this paper investigates and validates the proposed control design with reduced complexity intended for marine water pumping system employing an induction motor (IM) drive and MMI. The analysis of inverter is carried out with Proportional-Integral (PI) and Fuzzy Logic (FL) based controllers for improving the performance. A comparative analysis has been made with respect to better robustness in terms of peak overshoot, settling time of the controller and Total Harmonic Distortion (THD) of the inverter. Simulations are undertaken in MATLAB/Simulink and the detailed experimental implementation is conducted with Field Programmable Gate Array (FPGA). The results thus obtained are utilized to analyze the controller performance, improved inverter output voltage, reliable induction motor speed control and power quality improvement by reduction of harmonics. The novelty of the proposed control scheme is the design and integration of MMI, IM drive and intelligent controller exclusively for marine water pumping applications.

**INDEX TERMS** Field programmable gate array, fuzzy logic controller, induction motor drive, modular multilevel inverter, proportional-integral, total harmonic distortion.

## I. INTRODUCTION

In worldwide, considerable efforts been taken by the maritime and shipping industries to deteriorate the level of atmospheric emissions and energy consumption. The deterrence of pollution in the marine environment and accidental

causes are strictly followed by certain rules which are framed by International Convention for the Prevention of Pollution from Ships organization (MARPOL) [1], [2]. Due to climate change and global greenhouse gas emissions, the shipping contribute about 3% of global CO<sub>2</sub> emissions from diesel engines involved in marine sectors [3].

The marine shipping diesel engines emits 2.8% of Carbon dioxide (CO<sub>2</sub>), 15% of Nitrogen Oxides (NO<sub>x</sub>), 13% of

The high-gain DC to DC Converter widely used in industrial and power system applications. In particular, the non-isolated converters are highly prepared due to their size and cost. The application such as photo-voltaic (PV) and wind power system, the combination of non-isolated converter and inverter are used. These converters are selected for the specific applications depend on the circuit complexity, reliability and cost. With respect to PV applications, the simple boost wider range voltage gain DC to DC converter is better choice to meet the DC-link voltage of the PV inverters. Comparing with conventional inverters, multi-level inverters (MLIs) are the worthy option, as it has a superiority to suppress the voltage and current harmonics. Even though the reduced switch MLIs are well-established for medium voltage PV system, still the challenges beside to improve voltage harmonic, voltage enhancement, increasing the inverter efficiency etc. Hence, in this paper proposes the PV Power system with single switch non-isolated high-gain DC to DC converter and reduced switch seven-level MLI inverter. The proposed converter is developed with the mixtures of boost and cuk converter; hence it has wider range of control with good efficiency. The experimental study of 400W PV system is established. The experimental results are conformed the theoretical investigation.

[http://dx.doi.org/10.6180/jase.202106\\_24\(3\).0017](http://dx.doi.org/10.6180/jase.202106_24(3).0017)

## 1. Introduction

The photo-voltaic (PV) power structure, power electronics converters role is unavoidable to converter electrical power DC-DC-AC. There are varieties of converter (DC to DC) and inverter (DC to AC) is recommended by the researchers including with basic boost converter and conventional two-level inverter [1]. Usually, the energy conversion from the photo-voltaic system is implicit to be in a close-fitting area of the maximum power point (MPP) in the PV voltage-current characteristic due to the maximum power point tracking (MPPT). Therefore, this is a significant point to be well-thought-out in the identification of the PV equivalent

parameters of a typical model for the voltage- current characteristic. Several of methods of MPPT method are used in several applications. Subjected to the PV converters and its applications, different aspects are considered to enhancing the PV power [2, 3]. In additional more accurate MPPTs techniques and more sensors are essentials. Generally, in PV to measure the voltage sensing is easier than current. The temperature sensors or irradiance sensors are very expensive and unusual.

The MPPTs techniques might be dependent (indirect) or independent (direct) on PV array parameters. In the direct measurement methods uses the voltage and/or current

Dear Mr. S MUKESH,

Subj: Offer for the post of "Operator"

With reference to the interview you had with us on 24th December 2020, for the post of "Operator," We are pleased to offer you an appointment in our organisation, on the following terms & conditions.

### A) SALARY & OTHER ALLOWANCES

- 1) You shall be paid a Salary of Rs. 2000/- ( Rupees Twenty Thousand and Paise Zero Only ) per month, which is subjected to statutory deductions viz., PF/Professional Tax etc. The salary is inclusive of food, conveyance, Medical (other than group medical) and Accommodation hence no other separate allowance will be provided. A Detailed breakup of the CTC allowance is given in Annexure 1, attached to this.
- 2) In addition to the above salary, you are also eligible for the Group Personal Accident Policy and Mediclaim Policy, as per the rules of the Company.

### B) Terms of Offer:

- 1) Place of Posting:  
At present you will be positioned at " South Region " However, you may be transferred anywhere in India depending upon the requirement of the job.
- 2) Probation:  
Your Probation Period with the Company shall be for One Year, from the date of your joining the duties of our company. On successful completion of your probation period to the satisfaction of management, your services in the company will be confirmed & you will be eligible for any other allowances.
- 3) Date Of Joining:  
You shall join the company latest by Immediately.
- 4) Fitness:  
Appointment and continuation of your service is subject to your being found and remaining Medically (physically and mentally) fit. Also note that the Management is engaged in the O & M of LPG and it will be your responsibility to take necessary safeguards for your safety. The Management will not be responsible for any accident due to negligence. You are also asked to submit Medical fitness certificate at the time of joining.

Bharanidharan K L

B.Tech/B.E. Electronics and Electrical Engineering  
Kongu Engineering College ,Erode

Dear Bharanidharan,

Further to our offer for the position of Programmer Analyst Trainee and in response to your confirmation into the Internship opportunity we had extended, we are pleased to offer you an **Internship** with us for a **period of 3 to 6 months**, during which you will be offered a stipend Amount of **INR 12000/-** per month based on the Internship performance and completion.

Actual Internship dates and duration would be based on the business demand aligned skill tracks offered to you and would be shortly communicated to you.

Cognizant Internship being a pre joining skill and capability development program, it would form a critical part of your employment with Cognizant.

You will undergo a learning curriculum as per the learning track assigned to you. The learning path will include in-depth sessions, hands on exercise and project work. There will also be series of webinars, quizzes, SME interactions, mentor connects, code challenges, assessments etc. to accelerate your learning. The performance during Internship would be monitored through formal evaluations.

The Cognizant Internship completion would qualify as the entry criteria to your post joining training program and would be used as basis towards your allocation to projects/roles.

Prior to joining Cognizant, you must successfully complete the prescribed Internship program. In event of non-completion of the Internship, Cognizant may at its sole discretion revoke this offer of employment.

Please also note that:

- The Internship Training will be done from Monday through Friday for 8 hours from 9 am to 6 pm (IST).
- Interns are covered under Cognizant's calendar holidays of the respective location of internship and you would need to adhere with attendance requirements. Pre-approvals are to be sought towards unavoidable leave or break requests from the program.
- There would be zero tolerance to plagiarisms and misconduct during the internship.
- You would be required to ensure timely completion and submission of assignments, project work and preparation required prior to the sessions.
- You may be required, to travel to other locations within India if there is a business need as per your internship plan.
- Cognizant reserves clauses regarding IT infra if applicable and access to information and material of Cognizant during the period and could modify or amend the Cognizant GenC program terms and conditions from time to time.

At the time of your reporting for the internship, you will be required to sign a Non - Disclosure Agreement with the company. During the course of your Internship and after completion of the same, you are required to maintain strictest confidentiality with respect to company proprietary or products that you access or come into contact with, during your project as an Intern, at all times as per our Policy. Use of company proprietary information or products shall not be made without prior permission from the concerned authority.

You will also be required to submit the following documents at the time of reporting;

- Photocopy of your Passport & Visa

- Photocopy of your Certificates / Mark Sheets in support of your Educational Qualification(s)
- 2 Passport-size photographs
- Pan Card
- Aadhar Card
- Personal individual bank account from a nationalized bank for processing stipend

Please do not hesitate to call us for any information you may need.

We wish you good luck.

Yours sincerely,

For **Cognizant Technology Solutions India Pvt. Ltd.,**

Suresh Bethavandu

**Global Head-Talent Acquisition**

I accept the terms and conditions of the offer as mentioned above.

Dear student,

**OFFER LETTER: UTP VIRTUAL RESEARCH ATTACHMENT PROGRAMME (VRAP)**

We are pleased to inform that your application to participate in Universiti Teknologi PETRONAS Virtual Research Attachment Programme has been accepted.

Details of program are as follow:

Name of Supervisor	: AP Dr Fawnizu Azmadi Bin Hussin
Topic	: Comparative Analysis of Post-Quantum Cryptographic Algorithms
Course	: Electrical & Electronics Engineering
Duration	: 20 January 2021 – 19 March 2021

This offer is subject to the following conditions:

**1. Rules and work expectations.**

- 1.1 While working remotely, students must adhere to all the terms and conditions.
- 1.2 Student may be eligible to work if their duties can be met through basic hardware and software agreed with Supervisor, they have proven to be trustworthy, disciplined, and self-motivated, and have been given permission by the institution.
- 1.3 Students must follow the work schedules provided to them, be sure to meet deadlines, uphold high-quality standards, and submit the requested reports.
- 1.4 Flexibility is allowed, but the students must agree to work set hours as much as possible, five days a week. Performance and progress will be measured weekly.
- 1.5 Tools will be made available by Supervisor to students for managing time and tasks, communicating, logging, and tracking projects, and accessing resources.

**2. Communication.**

- 2.1 Students are to be online and accessible during agreed time set by Supervisor.
- 2.2 Any correspondence must be answered as per requested and tools for communicating with team on projects shall be decided earlier with Supervisor.
- 2.3 Meetings shall be scheduled for at least once a week. Times are to be discussed and agreed upon between the Supervisor and student.

### 3. Insurance and liability.

- 3.1 Students are advised to choose a safe and secure location to work from, and to maintain high levels of safety.
- 3.2 UTP is not liable for injuries suffered in the pre-defined workspace during work hours.

### 4. Intellectual Property Right

- 4.1 UTP asserts and claims the right, title and/or interest to all Intellectual Property created by Students during VRAP as detailed out in **UTP Intellectual Property and Commercialisation Policy**.

### 5. Security and confidentiality.

- 5.1 Upon start, securing data and research information should be students' utmost concern. Any breaches in security protocol will lead to strict and swift disciplinary action.
- 5.2 Information and documents furnished to UTP must be true and correct.
- 5.3 Students shall not disclose, divulge, and make public, for whatever purpose or reason any information received from UTP, without specific written permission from UTP. "Confidential Information" shall mean any and all information, data, design, memoranda, models, prototypes, and/or other material whether of scientific, technical, commercial, financial or other nature, furnished to or obtained by the students from UTP, in written, oral or other tangible form clearly marked or designated as "Confidential" or orally or visually obtained during VRAP.

### 6. Cancellation of Offer

- 6.1 UTP reserves the rights to withdraw the offer in the event:
  - a. Any information/document(s) furnished to UTP was found to be untrue.
  - b. Student fail to meet programme requirements, terms, and conditions.

This offer is made subject to you being given approval by your Institution and been accepted by UTP researchers to supervise you with the agreed topic.

Please confirm your acceptance by fill in the online acceptance form provided in your email by 22<sup>nd</sup> January 2021. If we do not receive reply from you by then, this offer will be automatically considered void.

Thank you.

VALLIOOR, RADHAPURAM TALUK,  
TIRUNELVELI-627117, TAMIL NADU.

Dear Mr. MEENATCHI SUNDARAM U,

### OFFER OF EMPLOYMENT

We are pleased to offer you employment for the position **MEMBER TECHNICAL STAFF** with **ZOHO CORPORATION PRIVATE LIMITED**.

### INTERNSHIP AND STIPEND

You are expected to do the final semester project of your curriculum in our organization. We expect you to work on the project on a full time basis for a period of 5-6 months. During this period you will be paid a monthly stipend of **Rs.15000/- (RUPEES FIFTEEN THOUSAND ONLY)**. The following offer is valid, subject to successful completion of your project.

(Note: The above may not apply to you if your college does not permit internships)

### REMUNERATION

Your annual Cost to Company will be **Rs.480000/- (RUPEES FOUR LAKH EIGHTY THOUSAND ONLY)**. The break-up of your gross salary and information specific to bonus and gratuity are set out in Annexure A. Salary will be paid by the last day of each month. All additional benefits that Zoho currently provides employees are set out in Annexure B.

### DATE OF JOINING

Your date of appointment is effective from your date of joining after successful completion of your curriculum.

### PROBATION

You will be on probation, at a minimum, until completion of the performance review cycle that immediately follows completion of six months from your date of joining, provided that your performance is determined to be satisfactory. If your performance is not satisfactory, your probation may be extended until your performance is determined to be satisfactory. Upon completion of the probation period you will be confirmed on the rolls of the company.

### SALARY REVISION

Revision to your compensation will be after one year from the date of joining, subject to satisfactory completion of the probation by you. Zoho operates a Pay-for-performance Policy and any salary revision will take your performance into account.

Corporate Identification No: **U40100TN2010PTC075961**

e-mail ID: **hr-team@zohocorp.com**

Dear Manikandan A,

Date: 21 May 2021

We are pleased to confirm your Internship with Maersk Global Service Centers (India) Pvt. Limited (hereinafter referred as "Company") on the following terms and conditions with effect from **31 May 2021** for a period of six months. Accordingly, your internship will come to an end on **30 November 2021**.

1. **Scope:** You will perform internship in **PMA** on **Daily team tasks**, and such other scope of work as intimated by the Company from time to time.
2. **Location:** Your location for Internship with the Company will be **Bangalore**.
3. **Intern Mentor:** An employee from **Manos Sochorakis's** team will act as your 'Mentor' during the tenure of your internship with the Company and will supervise all aspects of your internship. If for any reason, the assigned Mentor is unable to continue to serve as your Mentor, the Company shall appoint another person as the Mentor under whose aegis you shall continue your internship. Your assignment and schedule would be as per the discussions with your Mentor.
4. **Business hours:** Unless otherwise agreed upon, the working hours during your internship would be from 9:30 a.m. to 6:30 p.m. from Monday to Friday.
5. **Review meetings:** The Intern Mentor along with such other individuals as deemed appropriate by the Company may conduct periodic review meetings (as needed) with you to discuss on progress of various parameters agreed upon, assessment of milestones as well as any issues arising from your internship.
6. On completion of your internship you will be required to submit the project report (if applicable) to your Mentor and the HR team, basis which the Company will issue the internship completion certificate.
7. You will perform your assignments in an independent capacity, and nothing in this offer/ Agreement shall be construed to give you the power or authority to act for, bind, or commit on behalf of the Company in any way. Nothing herein shall be construed to create the relationship of partners, employer and employee, or principal and agent.
8. **Stipend:** In consideration of your performance during the internship, the Company agrees to pay a fixed sum of **INR 40,000** per month as Stipend with effect from the Effective Date, subject to deduction of applicable taxes. The above sum represents the entire compensation for your internship with the Company for the tenure agreed upon.

Dear Sakthi G,

Date: 17 May 2021

We are pleased to confirm your Internship with Maersk Global Service Centers (India) Pvt. Limited (hereinafter referred as "Company") on the following terms and conditions with effect from **31 May 2021** for a period of six months. Accordingly, your internship will come to an end on **30 November 2021**.

1. **Scope:** You will perform internship in **Athena** on **Developing codes**, and such other scope of work as intimated by the Company from time to time.
2. **Location:** Your location for Internship with the Company will be **Bangalore**.
3. **Intern Mentor:** An employee from **Lakshmi Sivakumar's** team will act as your 'Mentor' during the tenure of your internship with the Company and will supervise all aspects of your internship. If for any reason, the assigned Mentor is unable to continue to serve as your Mentor, the Company shall appoint another person as the Mentor under whose aegis you shall continue your internship. Your assignment and schedule would be as per the discussions with your Mentor.
4. **Business hours:** Unless otherwise agreed upon, the working hours during your internship would be from 9:30 a.m. to 6:30 p.m. from Monday to Friday.
5. **Review meetings:** The Intern Mentor along with such other individuals as deemed appropriate by the Company may conduct periodic review meetings (as needed) with you to discuss on progress of various parameters agreed upon, assessment of milestones as well as any issues arising from your internship.
6. On completion of your internship you will be required to submit the project report (if applicable) to your Mentor and the HR team, basis which the Company will issue the internship completion certificate.
7. You will perform your assignments in an independent capacity, and nothing in this offer/ Agreement shall be construed to give you the power or authority to act for, bind, or commit on behalf of the Company in any way. Nothing herein shall be construed to create the relationship of partners, employer and employee, or principal and agent.
8. **Stipend:** In consideration of your performance during the internship, the Company agrees to pay a fixed sum of **INR 40,000** per month as Stipend with effect from the Effective Date, subject to deduction of applicable taxes. The above sum represents the entire compensation for your internship with the Company for the tenure agreed upon.

## TERZO TECHNOLOGIES PRIVATE LIMITED

Date: 2nd Aug 2021

Dear Ahamed Ruyas

We are delighted to offer you an opportunity to join our team as an Intern. Your internship will start from Aug 16th 2021. You will be paid Rs 15,000/month during the internship period. Your responsibilities will be given at the start of the internship.

Upon successful completion of degree, you will be given a full time opportunity to join us and your annual package will range between 4.5 LPA to 7 LPA depending on your performance during internship period.

We will work closely with your college to ensure that all the appropriate steps have been taken to make this an exciting and positive experience for you.

Looking forward to having you part of the Terzo family...!!

Thanks,

(Terzo technologies Pvt Ltd)

Dear Yazhini,

This is further to your project assignment in our organization as a part of your academic curriculum requirement with our design and development center at **Trivandrum** from **06 September 2021 to 31 May 2022** under the following terms and conditions.

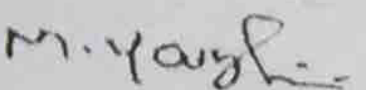

1. You will be paid all inclusive stipend of **Rs. 15,000/-** per month for the period of **9 Months and w.e.f. 06 September 2021 to 31 May 2022.**
2. During the period of assignment you shall administratively report to **Mr. Shahid K.** and carry out all aspect of project assigned to you.
3. Information pertaining to the company's operations shall remain secret and safeguarded by you both during and after your tenure of assignment with us.
4. Breach of any of the above conditions will render you liable to termination of your assignment without notice.
5. The company is not obliged to offer you permanent employment on the completion of the assignment and you shall not be entitled to or can claim any benefits applicable to employees of the company.

Please sign the duplicate copy of this letter in token of your acceptance of the terms & conditions contained herein.

We wish you all success in your assignment.

Cordially,

Dear Sir,

Greetings from Kongu Engineering College!!!!

Kongu Engineering College is one of the foremost multi professional research-led Institutions is internationally a recognized leader in professional and career-oriented education. Department of Electrical and Electronics Engineering provide uniquely rich and diverse learning and teaching environment for the students.

As a part of the curriculum, the final year M.E students are required to undergo internship work in the industry. We feel that it will be fruitful if our students with good academic performance undergo internship to strengthen their knowledge and skills.

As per the telephonic conversation, I have referred one student named S. Aswath based on his interest. Currently he is doing final year M.E - Power Electronics and Drives.

I request you to kindly accord permission to the above-mentioned student to undergo internship in your esteemed organization. We assure you that our student will strictly adhere to rules and regulations of your organization and will give their contributions to the industry.

Thanks and Best Regards,

Mon, 11 Oct 2021 at 1:25 p.m.

Dear Gopinath,

Thank you for your interest in working for our organization. Having successfully passed the interviews we are pleased to offer you a position with Calibraint Technologies. It is my pleasure to extend the following offer of employment to you on behalf of Calibraint Technologies. If you accept this offer you will be designated as an **Associate Software Developer - Trainee** and you will join us at our Chennai office.

Your joining date for training will be on 18th October 2021.

Please find the below details we would like to put forward

- We are expecting you to join on the date we mention where you will be having one to two month training to prove yourself where you will be receiving a stipend of Rs.10,000/-per month in the second month training.
- Once after the completion of your training, you will be offered as the employee with the compensation of **3.5 Lakhs Per Annum** based on the performance during the probation period.

If you are unable to report for joining on the said date you are requested to inform the company in writing. If there's any changes from our side it will be informed to you through mail or call. The following documents are required to be produced at the time of joining. Please provide originals and self-attested photostat copies; originals will be returned after verification.

1. Proof of Academic Qualification (Class 10th Equivalent and above):

- 10th & 12th mark lists
- Undergraduate/degree mark list and degree certificates
- Post-graduation mark list and degree certificates (if any)
- Other qualifications - mark lists and certificates (if any)

2. Proof of identity photocopy i.e. PAN card, Aadhar Card, Driving license/Voter ID

3. Photographs (2 copies)

**We take great pleasure in welcoming you to our Organization and sincerely hope that your period of service with us will be long, pleasant and of mutual benefit. We hope you will find this offer acceptable and wait to welcome you to the Calibraint Technologies family.**

**Venue:** TICEL Bio Park  
Block II, 5th floor  
Taramani Road, Taramani,  
Chennai,

Date: 13-NOV-2021

Ms. Charan Ganesh Shanmugapriyan,  
4/131, Ponnagar,  
Gorimedu,  
Salem, Tamil Nadu - 636 008.

Dear Mr. Charan Ganesh,

**Sub: Offer of Internship cum Employment**

Congratulations! With regard to our recent discussions with you, we are pleased to invite you to accept the offer on the following terms:

**Designation** : Internship – Digital Intern  
Probation period – Project Trainee  
FTE – Associate Product Engineer – Digital Platforms

**Internship Period** : 1 December 2021 to 31 May 2022

**Employment Starts** : 1 Jun 2022

**Location** : Due to the extant ongoing pandemic you will be working virtually until further notice. Company will communicate the date when you should report to our office in Bangalore, Karnataka

You will be receiving academic credit during internship, you will be paid a stipend of Rs. 5,000 per month. During probationary period, your revised stipend will be Rs. 25,000/- per month. On successful completion of probation, the FTE starts and your consolidated CTC including compensation and benefits will be Rs. 4,00,000/PA (Rupees Four lakh per Annum)

You will be directly reporting to the Product Manager or the Line manager which will be communicated to you at the time of joining for all job tasks assigned to you.

You will be deemed to be on probation in the services of the company until confirmed in writing. The initial period of probation is 6 months. The probationary period will also be your training period. Owing to the cost of the training incurred by the Company, you agree to sign an employee bond for a period for Two (02) years from the date of completion of the training.

Upon your acceptance of this Offer Letter, we will be issuing the appointment letter to you which will have the terms of your employment.

We take great pleasure in welcoming you to our company and sincerely hope that your period of service with us will be long, pleasant and of mutual benefit.

Please self-attest the copy of this letter as an acceptance and return the same within three (3) days from the date of the receipt of this document, failing which this offer shall stand withdrawn.

Sincerely,  
For Intersect Innovations Private Limited

## ABSTRACT

The output of renewable energy is the power of low voltage and high current rated designs. Due to the output voltage being too low it does not meet the required maximum voltage load requirements. Therefore, in order to meet the high voltage load, the required limit of the power converter (DC-DC) is used to increase the voltage to the maximum. The DC output voltage from a renewable energy source is given as input to a DC-DC converter, and the output generated from the converter is used to drive a load. KY boost converter is one of the recently developed DC-DC converters to reduce output voltage ripple. It is suitable for operation in equipment to below low ripple conditions. The disadvantage of this converter is that the boost voltage is a very low design parameter. To obtain the desired boosted voltage, and also to reduce the output voltage ripple, an optimized algorithm is used. Compared with the existing Drosophila optimization technology, the proposed Adaptive Vector Reference Control (AVRC) Method has higher convergence characteristics and lower output ripple. The simulation results are verified by MATLAB simulation with hardware results. The hardware is developed using the Xilinx FPGAs SPARTAN 6A controller, which simplifies the XC3S500E development board prototype in addition to providing additional flexibility for further improvements. The results clearly show improved performance and validate the model.

## 1. Introduction

The discovery of oil pollutants and greenhouses gases affecting supply, legalization needs to expand new innovations for transportation as a real-time alternative that is primarily based on internal combustion engines [1]. Fuel cells guarantee their best pace of work more skilled than usual and with less radiation.

A hybrid propulsion system combines two sources, such as fuel cell and battery. The fuel cell converts the chemical energy into electrical energy. The stack has an expansion that isn't permitted by a unique moderate reaction or a fast diminishing in yield power, and energy recuperation. The battery is used as a storage source. In addition, during vehicle startup, and also when power requirements are high, the battery acts as an additional source.

The alteration of the voltage level between the two sources and the load on the vehicle requires a converter (KY boost converter) to persistently keep up the voltage of the DC transport allowing

the applied power or the current required by the load, for instance appeared in Fig. 1. The other converter is an inverter, which is used to change the voltage level between the DC association and Permanent Magnet Synchronous Motor (PMSM). In a stationary express, the vitality that the energy component stack must convey is relied upon to move the electric vehicle. Power devices will transform into the key vitality hotspot for the exceptional age electric vehicles [2].

This article proposes a KY boost converter with minimum voltage ripple operation between batteries used as HEVs and part of the inverter-fed PMSM. The advantages of the proposed innovation [3], for instance, decrease the size of detached parts, lessen input current ripple, make the framework progressively dependable in high power applications, extend the proficiency of the converter, diminish voltage and power gadgets Device evaluated current.

The aforementioned advantageous cases of the proposed converter make it more reliable in the application of high-power hybrid electric vehicles. Broad simulation results affirm that the FPGA control conspire gives a successful method for altering the yield voltage of the Polymer Electrolyte Membrane Fuel Cell (PEMFC) in light of changes in load request. An enormous number of

This work was supported by the Department of Science and Technology (Government of India) through the ASEAN-India Science, Technology and Innovation Cooperation (AISTIC) Scheme for the Project Design and Development of Smart Grid Architecture With Self-Healing Capability Using Intelligent Control Techniques-A Smart City Perspective under Grant CRD/2018/000075.

**ABSTRACT** The presence of harmonics in solar Photo Voltaic (PV) energy conversion system results in deterioration of power quality. To address such issue, this paper aims to investigate the elimination of harmonics in a solar fed cascaded fifteen level inverter with aid of Proportional Integral (PI), Artificial Neural Network (ANN) and Fuzzy Logic (FL) based controllers. Unlike other techniques, the proposed FLC based approach helps in obtaining reduced harmonic distortions that intend to an enhancement in power quality. In addition to the power quality improvement, this paper also proposed to provide output voltage regulation in terms of maintaining voltage and frequency at the inverter output end in compatible with the grid connection requirements. The simulations are performed in the MATLAB / Simulink environment for solar fed cascaded 15 level inverter incorporating PI, ANN and FL based controllers. To exhibit the proposed technique, a 3 kWp photovoltaic plant coupled to multilevel inverter is designed and hardware is demonstrated. All the three techniques are experimentally investigated with the measurement of power quality metrics along with establishing output voltage regulation.

**INDEX TERMS** Harmonics, intelligent control, multilevel inverter, photo voltaic's, power quality, voltage regulation.

## I. INTRODUCTION

Providing electrical energy access to rural zones is a fundamental requirement as a means of improving sustainable living standards topping the agenda in many developing countries [1]–[4]. Energy efficiency, electricity supply and sustainability are the most important research topics in society. The energy that is sustainable, renewable, cost-effective, reliable and secure is the fundamental requirement

The associate editor coordinating the review of this manuscript and approving it for publication was Alfeu J. Sguarezi Filho <sup>1b</sup>.

for economic growth, human and industrial development of a country. Ecological concerns, exhausting petroleum reserves and expanding reliance on fossil fuels from unstable locales have expanded the significance for more efficient use of energy. Sources like thermal, nuclear that has been used for some time now for the generation of electricity has its own merits and demerits. The developing attention to decrease the carbon footprint (CO<sub>2</sub>) has added to the expanding interest for research on non-fossil based fuel as a source of energy. Thus, a more sustainable energy supply is required across all sectors viz. residential, transportation, industrialisation

## ABSTRACT

The growth of the renewable energy sector with solar energy resources playing a pivotal role, the proliferation of waste generated from the industry is a cause for concern. Globally the installed solar capacity is over 500 GW and is expected to rise further to 5000 GW by 2050. This phenomenal growth is expected to generate huge solar waste of up to 15% given the anticipated life span of 25 years. While the recent trends in solar research are aimed at improving little efficiency importance is given to waste disposal of dismantled solar power panels. Though recycling is an option, few companies are capable of handling recycling efficiently. To address this problem while ensuring environmental conservation and resource availability & recycling, the technologies adopted in the field are discussed and reviewed in this article. By 2050 60 million tons of solar waste will be there if it is not recycled properly. There view provides an in-depth assessment and the various technical aspects of the solar panel waste recycling and recovery, environmental protection, waste management. The economics of solar power recycling, impact on health and environmental and policies are discussed to ensure feasible and non-toxic technology for further development.

## 1. Introduction

The growth of the renewable energy sector offers numerous benefits in the form of safety, reliability, efficiency, effects on the environment and so on. Solar energy technology has witnessed tremendous growth in the recent past, with investments ranging over billions of dollars. The user of solar power has also contributed tremendously towards the reduction in emissions, and it is this feature that has attracted governments across to spend, invest and attract investments in the sector. It is expected that the solar power will make up and replace a significant amount of energy generated by non-renewable energy sources (Bakhiyi et al., 2014) worldwide and is likely to aid in meeting energy demands across households. The entire world is working together in the process of implementing large scale solar power plants to satisfy the energy demand (Chi et al., 2014). According to world data (Table 1), the total solar energy generated accounted for

# Design of a Novel Boomerang Trajectory for Sliding Mode Controller

Kamalesh MS\* , Senthilnathan Nattuthurai, and Bharatiraja Chokkalingam

**Abstract:** Sliding Mode Controllers (SMC) is widely known for its robustness and controllability for a non-linear system during transient conditions. The main advantage of SMC is that of sliding a control variable along the trajectory and converges to zero or nearest to zero and make the system to attain a stable condition. Various methodologies and approaches like discontinuous controllers, second-order sliding modes, twisting algorithms, etc. are available for the SMC implementation. However, every algorithm is facing the problem of convergence and error tracking in a finite amount of time. The primary purpose of this paper is to formulate and design an SMC with a new trajectory which overcomes the drawback of the existing methodologies. This paper proposes a novel boomerang trajectory, which omits the reaching phase and follows a semi-elliptical and semi-circular path for a quick convergence. SMC with boomerang trajectory is analyzed for its stability at transient conditions, and the results show significant improvement in terms of convergence time when compared to the existing trajectories and also it is asymptotically stable. The entire system is simulated in Matlab / Simulink and the same prototypical setup has been designed, and implemented for evaluation purpose using dSPACE-MicroLabBox-ACE-DS1202 platform.

**Keywords:** Boomerang trajectory non-linear system, sliding mode control, trajectory control, twisting algorithm.

## 1. INTRODUCTION

SMC evolved from Variable Structure Control (VSC) consisting of many sub-systems, changing its structures based on some control criteria. Also, an essential feature of SMC is that of having an undeviating system for any uncertain disturbances. SMC's are widely employed for the stabilization and control of various linear and non-linear systems such as satellite-carrying shuttle vehicles, underwater submarine vehicles, robotic manipulators and actuators, aircraft, satellites in the orbit, electrical motor control, etc. [1, 2]. SMC features are as follows; 1) stabilized dynamics even under uncertain perturbations, 2) robust control law for switching states on the desired sliding surface, 3) gain of the transfer function may be dynamically changed, contributing the continuity in the sliding plane or surface [3]. SMC design is a state space approach [4], consists of two significant steps, i.e.,

**Step 1:** designing a state trajectory for the system on the hyperplane.

**Step 2:** deriving a control law for the system to slide and follow the trajectory and reach a stable condition with minimum or zero reaching time ( $t_r$ ).

The problem in designing a state trajectory starts with

the declaration of state variables and their parametric variations. Always the state trajectory begins with an initial condition of the state variable and tracks towards the sliding surface. The sliding variable  $\sigma(x)$ , derived from the state variables  $x_1, x_2, \dots, x_n$  tries to achieve the compensated dynamics based on the control law. The first and foremost property of  $\sigma(x)$  is to have a stable differential equation, which converges to zero with respect to change in error. There are many approaches discussed in the literature like adaptive linear sliding control [5, 6], integral sliding surface [7], multi-segment SMC [4, 8], fuzzy-based gain scheduling SMC [9], fuzzy-based state feedback system [10], adaptive fuzzy sliding control law [11], etc. Most of the above-said techniques employ a linear sliding surface with different control laws based on the application requirement. The literature mentioned above with the linear sliding surface suffers from exponential convergence and compromises the inclusion of reaching phase and reaching time leading to increased control gain. In such systems, a variable starting from any initial position moves monotonically towards the switching hyperplane and converges after the required reaching time. These complications were addressed by employing a non-linear curvature-based trajectory like parabolic tra-

## Abstract

**Purpose** – This paper aims to examine the design and control of a symmetric multilevel inverter (MLI) using grey wolf optimization and differential evolution algorithms.

**Design/methodology/approach** – The optimal modulation index along with the switching angles are calculated for an 11 level inverter. Harmonics are used to estimate the quality of output voltage and measuring the improvement of the power quality.

**Findings** – The simulation is carried out in MATLAB/Simulink for 11 levels of symmetric MLI and compared with the conventional inverter design. A solar photovoltaic array-based experimental setup is considered to provide the input for symmetric MLI. Field Programmable Gate Array (FPGA) based controller is used to provide the switching pulses for the inverter switches.

**Originality/value** – Attempted to develop a system with different optimization techniques.

**Keywords** Solar cells, Harmonics, Power converter, Differential evolution (DE), Grey wolf optimization (GWO), Field programmable gate array (FPGA), Maximum power point tracking (MPPT), Modulation index ( $m_a$ ), Total harmonic distortion (THD)

**Paper type** Research paper

## Introduction

The modern generation system having the power demand for electrical energy to the public and expanding applications in industrial and residential needs. The challenging task to meet the developing force request could be to expand the producing limit of a power plant. It involves thousands of crores as the venture and expands the number of years for its power generation (Umer Akram *et al.*, 2018).

The energy of natural fuel such as coal or gas has not a worthy resource to address completely the requirements of today's human beings. Fossil fuel has caused major environmental damage and enervation. This issue has imitated the alternate energy source radically (Liming Liu *et al.*, 2014). Other great arrangements would be the utilization of non-conventional or renewable sources are the most successful

technology to furnish the above challenge for power demand. One best discovery of more popular technology is solar photovoltaic (SPV) systems (Leon *et al.*, 2016; Samadaei *et al.*, 2016). Modern renewable power generation has variable nature of power flow from such as solar and wind becoming very popular demanding. SPV and wind energy have two extremely developing renewable energy sources, exclusively solar has attained more acceptance due to the dramatic reduction in its price over the past decade. There are many advantages such as noiseless process and low preservation compared to other non-renewable energy sources. It also provides eco-friendly and zero pollution for an environment. The fundamental of the multilevel inverter (MLI) is divided into three main configurations, namely, neutral point clamped MLIs (NPC-MLI), flying capacitor MLIs (FC-MLI) and cascade H-bridge MLIs (CHB-MLI). In 1981, the NPC-MLI has introduced the first MLI for medium voltage applications.
